SECURE PRIVATE SPACE

Equinix offers secure private space that meets the most demanding security specifications for mission-critical government agencies.

Challenge to change

Digital transformation is driving the distribution of services and controls closer to customers, employees, partners and ecosystems. IT modernization is needed to meet the demand for highly reliable, secure and innovative services. A solution must leverage disruptive technologies, such as cloud computing, while not disturbing ongoing delivery.

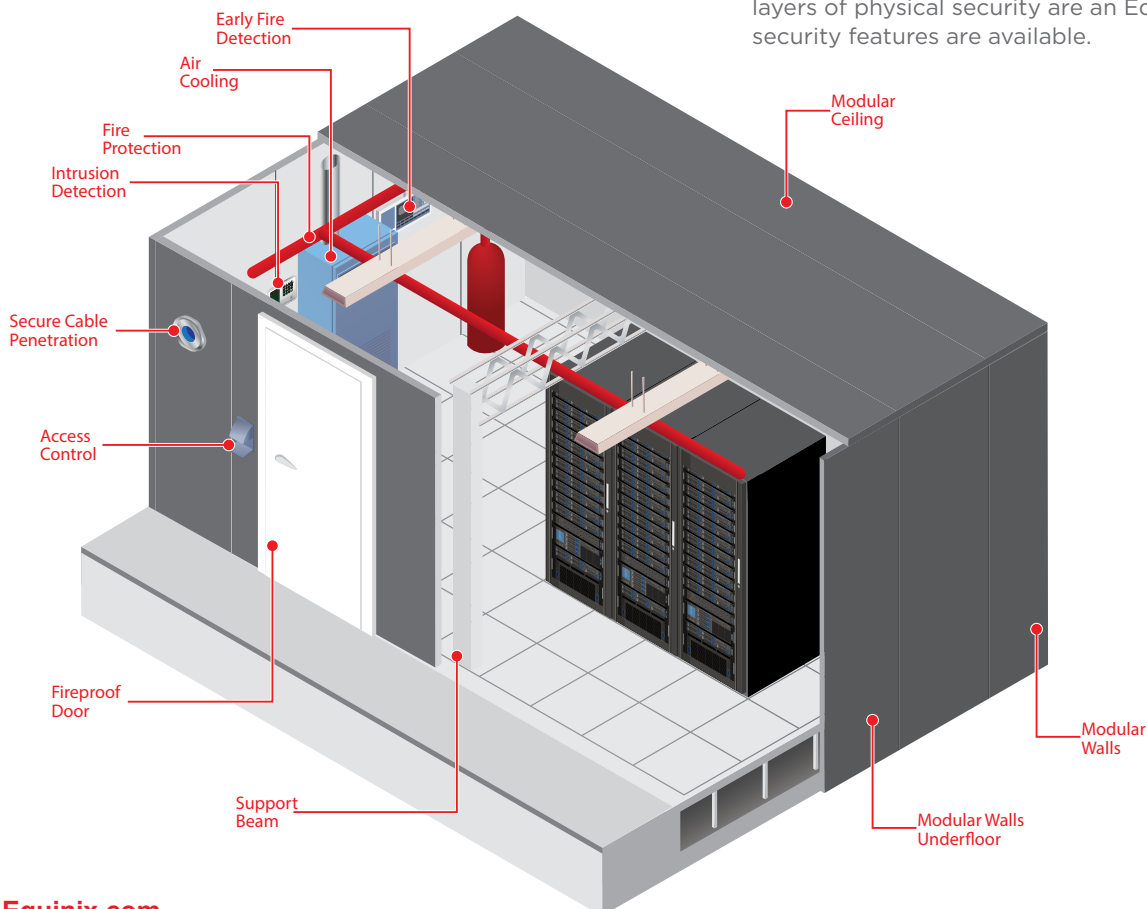

Security is also a must to maintain data as classified and to obtain off-premises colocation that complies with both the stringent data security requirements and the Data Center Optimization Initiative (DCOI). In conjunction with data security requirements, customers must find colocation that employs personnel with U.S. government security clearances, allowing them access to classified information or restricted areas.

Solution that transforms

Platform Equinix® offers a foundational global platform of secure, highly connected, carrier-neutral data centers to help boost application performance, optimize network architectures, enhance operational flexibility and lower costs. Equinix International Business Exchange™ (IBX®) data centers offer an industry-leading 99.9999% reliability globally.

Interconnection delivers transformational value by leveraging the power of proximity and neutrality in choosing network, cloud and IT providers within Equinix. Interconnection provides choice, options and value since Equinix delivers a dense ecosystem of network, cloud and IT service providers and partners.

Secure private space allows network gear and servers to be deployed for mission-critical applications and to maintain classified data within a dedicated space inside of a secure IBX data center. Equinix has multiple cleared facilities offering secure private space as finished and built-to-spec designs to meet the most aggressive delivery schedule. Five layers of physical security are an Equinix standard. Additional security features are available.

Standards and compliance

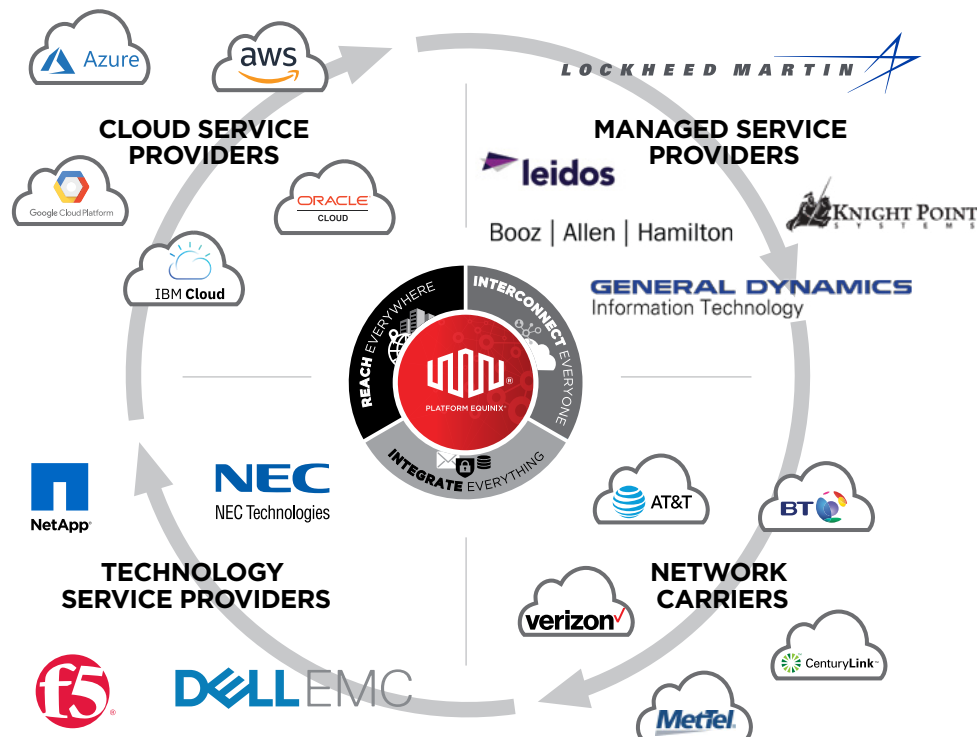

EQUINIX
